

1 Control panel

The CP-01 is a fictional training unit. This document demonstrates how a technical manual can preserve text, images and tables in a structured bundle. The display and the two push buttons are shown in Figure 1. Read the original figure to verify any automatically generated description.

Figure 1. CP-01 operator panel.

All names, values and graphics in this document were invented for a software demonstration. No real machine or proprietary manual is represented. The image contains information that is not repeated in the surrounding text.

2 Inspection schedule

The following fictional schedule demonstrates structured table extraction. Each row connects a component to its inspection interval and method. The table is represented using header-value rows, without sending it to a vision model.

Component	Interval	Method
Guard latch	Daily	Visual inspection
Drive belt	Monthly	Check tension
Air filter	Quarterly	Inspect and replace

These intervals are synthetic examples, not maintenance advice. The structured representation preserves which method belongs to each component. Users can inspect the source page alongside the extracted table and its serialized rows.
